## Atyos takes part in the “AWS Initiative on Amazon GuardDuty EKS Protection”

This year, Atyos is once again part of a European initiative launched by AWS, this time concerning the protection of Amazon Elastic Kubernetes Service (EKS) with Amazon GuardDuty.

The acceleration in the containerization of enterprise applications is also synonymous with an increase in security risks. Today, 75% of containers operate with critical vulnerabilities, and 19% of malicious container images detected in public repositories targeted Kubernetes components, including kubelet control planes and API servers.

That's where Amazon GuardDuty comes in. It's a threat detection service that uses machine learning, anomaly detection and built-in features to detect potential threats. It's the perfect solution to help you protect your Amazon EKS clusters in your AWS environment.

Our team of experts supports our customers in the implementation of Amazon GuardDuty within their infrastructure, so that their containers are as secure as possible from potential vulnerabilities.

The two AWS services in question are:

[Amazon Elastic Kubernetes Service](#)

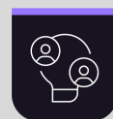

[Amazon GuardDuty](#)
